Copilot for Microsoft 365 - a ticking time bomb for **Compliance**

Microsoft 365 makes sharing files easy for collaboration—but without proper oversight, this convenience can lead to serious security and compliance issues. With the rise of Microsoft Copilot, which has access to the same documents as users, the potential for accidental data breaches increases.

The Difference Between Copilot for Microsoft 365 & ChatGPT

Copilot for M365 integrates OpenAI's ChatGPT model with your organization's Microsoft 365 data, allowing it to access documents and information stored in your apps to generate personalized outputs and assist with tasks. Unlike standalone AI models, Copilot works within your M365 environment, which raises concerns about potential data exposure if permissions are misconfigured.

The Copilot Challenge

- **Uncontrolled Data Access:** Copilot integrates with your Microsoft 365 data, potentially exposing sensitive information like accounting reports if permissions are misconfigured.
- **Inadvertent Data Exposure:** Without proper permission management, users might unintentionally access or expose confidential documents, increasing the risk of insider threats.
- **Compliance Risks:** Misconfigured permissions can lead to significant compliance issues, including data leakage, security vulnerabilities, and insider threats.
- **Insider Threats**: Increased risk of unauthorized access or misuse of sensitive information by internal users.

Why 365 Permission Manager is Essential:

- **Comprehensive Permission Oversight:** Get a clear view of permissions and sharing statuses across your Microsoft 365 environment, ensuring sensitive data is protected.
- **Automated Compliance Monitoring:** Enforce compliance policies for SharePoint, Teams, and OneDrive, ensuring users only see data they're meant to access. These policies prevent Microsoft Copilot from showing sensitive documents to users who shouldn't see them, safeguarding confidential information like salary details from unintended exposure.
- **Bulk Management and Quick Actions:** Efficiently manage and remediate permissions at scale, keeping your data secure and compliant.
- **Proactive Alerts and Audits:** Receive real-time alerts for policy violations and conduct audits to maintain strict control over data access and sharing.

While Copilot offers transformative productivity benefits, its integration with your Microsoft 365 data can pose serious risks if permissions are not managed carefully. 365 Permission

Manager provides the robust control and compliance tools needed to mitigate these risks, ensuring your sensitive information remains secure.
